- Polyhedral relaxation algorithms try to exploit the technology for Mixed Integer Linear Programming

 Introduction
 Lifted LP Algorithm
 Computational Results
 Final Remarks

 •••
 Polyheral Relaxation Based Algorithms
 ••

- Approximate convex sets using gradient cuts (tangent, benders).
- Cuts are in the original space.
- Usually only a few cuts are necessary.
- Sometimes convergence of cutting plane procedure is bad (e.g. Quadratic constraints).
 - Solution: Use a polyhedral approximation of the whole set.

Introduction

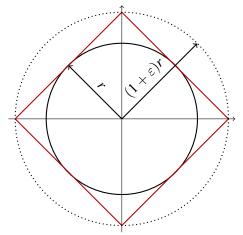

Lifted LP Algorithm

Computational Results

Final Remarks

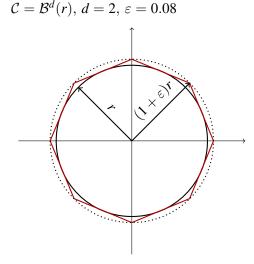

Polyheral Relaxation of Convex Sets

$$\mathcal{C} = \mathcal{B}^d(r), \, d = 2, \, \varepsilon = 0.41$$

- It is known that at least $\exp(d/(2(1+\varepsilon))^2)$ facets are needed in the original space.
- Ben-Tal and Nemirovski (2001) approximate $\mathcal{B}^d(r)$ as the projection of a polyhedron with $O(d \log(1/\varepsilon))$ variables and constraints.
- Glineur (2000) refined the approximation and showed that it is algorithmically and computationally "impractical" for (pure continuous) conic quadratic optimization.

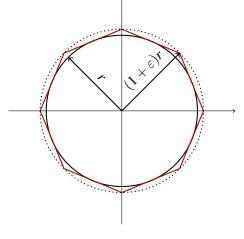

- It is known that at least $\exp(d/(2(1+\varepsilon))^2)$ facets are needed in the original space.
- Ben-Tal and Nemirovski (2001) approximate $\mathcal{B}^d(r)$ as the projection of a polyhedron with $O(d \log(1/\varepsilon))$ variables and constraints.
- Glineur (2000) refined the approximation and showed that it is algorithmically and computationally "impractical" for (pure continuous) conic quadratic optimization.

IntroductionLitted LP AlgorithmComputational ResultsFinal RemarksOos000000000000Using Ben-Tal Nemirovski Approximation to ExploitMixed Integer Linear Programming Solver Technology

• Lifted linear programming relaxation: Polyhedron $\mathcal{P} \subset \mathbb{R}^{n+p+q}$ such that

 $\mathcal{C} \subset \{(x, y) \in \mathbb{R}^{n+p} : \exists v \in \mathbb{R}^q \text{ s.t. } (x, y, v) \in \mathcal{P}\} \approx \mathcal{C}$

Use a state of the art MILP solver to solve

$$\max_{\substack{x,y,v\\ s.t.}} cx + dy
s.t. (x, y, v) \in \mathcal{P}$$

$$x \in \mathbb{Z}^{n}$$
(MILP)

(日) (日) (日) (日) (日) (日) (日)

- Problem: Obtained solution might not even be feasible for MINLP
- Solution: Modify Solve of MILP

Introduction Lifted LP Algorithm Computational Results o

Idea: Simulate NLP Branch-and-Bound

• Problem solved in NLP B&B node $(l^k, u^k) \in \mathbb{Z}^{2n}$ is:

$$z_{\mathsf{NLP}(l^k, u^k)} := \max_{x, y} \quad cx + dy$$

s.t. $(x, y) \in \mathcal{C} \subset \mathbb{R}^{n+p} \quad (\mathsf{NLP}(l^k, u^k))$
 $l^k \le x \le u^k$

Problem solved by state of the art MILP solver is:

$$z_{\mathsf{LP}(l^k,u^k)} := \max_{\substack{x,y,v\\ y,v}} cx + dy$$

s.t. $(x,y,v) \in \mathcal{P}$ $(\mathsf{LP}(l^k,u^k))$
 $l^k \le x \le u^k$

s.t. $(x, y, v) \in \mathcal{P}$ $(\mathsf{LP}(l^k, u^k))$
 $l^k \le x \le u^k$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○○

Issues:

- Integer feasible solutions may be infeasible for C.
- 2 Need to be careful when fathoming by integrality.

- Let $(x^*, y^*, v^*) \in \mathcal{P}$ such that $x^* \in \mathbb{Z}^n$, but $(x^*, y^*) \notin \mathcal{C}$.
- We reject (*x**, *y**, *v**) and try to correct it using:

$$z_{\mathsf{NLP}(x^*)} := \max_{y} \quad cx^* + dy$$

s.t.
$$(x^*, y) \in \mathcal{C} \subset \mathbb{R}^{n+p}. \qquad (\mathsf{NLP}(x^*))$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○○

 This can be done for solutions found by heuristics, at integer feasible nodes, etc.

- Suppose that for a node (l^k, u^k) with $l^k \neq u^k$ we have that the solution (x^*, y^*, v^*) of LP (l^k, u^k) is such that $x^* \in \mathbb{Z}^n$
- If (x*, y*) ∈ C then (x*, y*) is also the optimal for NLP(l^k, u^k) and we can fathom by integrality.
- If $(x^*, y^*) \notin C$ it is not sufficient to solve NLP (x^*) :
 - Problem: Corrected solution is not necessarily optimal for NLP(*l^k*, *u^k*).
 - Solution: Solve NLP(*l^k*, *u^k*) and process node according to its solution.

- Suppose that for a node (l^k, u^k) with $l^k \neq u^k$ we have that the solution (x^*, y^*, v^*) of LP (l^k, u^k) is such that $x^* \in \mathbb{Z}^n$
- If (x*, y*) ∈ C then (x*, y*) is also the optimal for NLP(l^k, u^k) and we can fathom by integrality.
- If $(x^*, y^*) \notin C$ it is not sufficient to solve NLP (x^*) :
 - Problem: Corrected solution is not necessarily optimal for NLP(*l^k*, *u^k*).
 - Solution: Solve NLP(*l^k*, *u^k*) and process node according to its solution.

Introduction	Lifted LP Algorithm	Computational Results ●0000	Final Remarks o
Computation	nal Experiments		

- Implementation of Lifted LP B&B Algorithm ($LP(\varepsilon)$ -BB):
 - Using Ben-Tal Nemirovski relaxation from Glineur (2000).
 - Implemented by modifying CPLEX 10's MILP solver using branch, incumbent and heuristic callbacks.
 - $\varepsilon = 0.01$ was selected after calibration experiments.
- Portfolio optimization problems with cardinality constraints (Ceria and Stubbs, 2006; Lobo et al., 1998, 2007):
 - 3 types, all restricting investment in at most 10 stocks.
 - Random selection from S&P 500.
 - 100 instances for $n \in \{20, 30, 40, 50\}$, 10 for $n \in \{100, 200\}$.
- Computer and solvers:
 - Dual 2.4GHz Xeon Linux workstation with 2GB of RAM.
 - LP(ε) -BB v/s CPLEX 10's MIQCP solver and Bonmin's I-BB, I-QG and I-Hyb.

Introduction	Lifted LP Algorithm	Computational Results	Final Remarks ●		
Final Remarks					

- Polyhedral relaxation algorithm for "convex" MINLP:
 - Based on a lifted polyhedral relaxation.
 - "Does not update the relaxation".
- Algorithm for the conic quadratic case:
 - Characteristics:
 - Based on a lifted polyhedral relaxation by Ben-Tal and Nemirovski.
 - Implemented by modifying CPLEX MILP solver.
 - Advantages:
 - Can outperform other methods for portfolio optimization problems.
 - Shows that Ben-Tal and Nemirovski approximation can be computationally "practical".
